

# DWA\_08 Discussion Questions

In this module you will continue with your “Book Connect” codebase, and further iterate on your abstractions. You will be required to create an encapsulated abstraction of the book preview by means of a single factory function. If you are up for it you can also encapsulate other aspects of the app into their own abstractions.

To prepare for your session with your coach, please answer the following questions. Then download this document as a PDF and include it in the repository with your code.

---

1. What parts of encapsulating your logic were easy?

Moving the book preview function and the day night function to a separate file and allocating the needed info for it

---

2. What parts of encapsulating your logic were hard?

Figuring how the different files interact when it comes to the data interaction and function interaction between 3 files while being read into a html file, and knowing how the system actually works made it harder for me

---

3. Is abstracting the book preview a good or bad idea? Why?

Yes and no, because the type of data being used was already in a easy location that could easily be read but when it comes to any program that might have new information to be loaded, 'show more', 'day/night' that could be used multiple times with the same function then abstraction is good

---
